

Connected TV Peripherals Expand Global Market Growth for Semiconductor Vendors

Worldwide hundreds of millions of consumers can cut the cord and ditch direct or cable to stream their movies and television shows from the Internet because the price of direct or cable combined with the expense of physical DVDs no longer make sense.

A profound shift in business is taking place with Set-tops and paid-for DVD rental services in one corner defending themselves and in the other, the less expensive and free-of-charge Internet entertainment offerings capturing more followers. All that's needed by the challengers is a module or card to hold a new TV connectivity peripheral that has become the means to reach the Internet and the services and Apps it offers.

The long-ago dream of PC makers trying to merge computers with the entertainment devices in the living room is finally taking place – but not as depicted many years ago. A small connectivity computing device has accomplished the task. It may be incorporated into the television but for better performance and future updates – it should be connected externally. Connected television peripherals enable consumers to access online entertainment, games, Apps, and other content on their new and old televisions at a fraction of the price they were paying for bundled entertainment and rental media.

The market for these internet connectivity peripherals is just beginning to grow. Some of these peripherals come as separate small systems or “dongles” while others are in the process of being incorporated into game consoles, Blu-ray players, and even Set-top boxes. Hundreds of designs will continue to penetrate these and other systems since through their low cost they can encourage consumers to get the latest micro-peripheral that provides more computing power, better connectivity, a higher definition image, and requires less power to run

Encore Info forecasts that by 2018, the global market for semiconductor components providing the connectivity and application support in connected TV peripherals will reach over 10.6 Billion US Dollars as TV over Internet gains over bundled services and rentals (See Figure 1). TV connectivity peripherals that support the user interfaces employing remote controls, “second screen” devices, voice recognition, and camera will benefit from the increases in demand for connected peripherals.

Figure 1. Worldwide Connectivity Semiconductor Revenue 2012-2018

Encore Info’s 55-page “Connected Television Peripheral Semiconductor Forecast 2012-2018” analysis provides status and five-year forecast of worldwide and regional shipments and revenues covering semiconductors employed in connectivity peripherals that are used in three consumer product categories: streaming controllers, game consoles, and Set-top boxes plus Blu-ray players. Targeting marketing and sales executives and product managers, the 17 business tables and accompanying MS Excel spreadsheets also include the ASP and BOM (bill of materials) of the connectivity peripherals employed in each of the segments.

Note: in addition to business status and forecasts Encore Info reports also provide technical overviews of products offered by selected companies as well as relevant standards and industry organizations.

The “Connected Television Peripherals Semiconductor Forecast 2012-2018” report covers:

- DLNA whose guidelines define how devices interoperate on a home network whether it uses Ethernet, Wi-Fi (including Wi-Fi Direct), MoCA (Multimedia over Coax Alliance), HPNA (Home Phoneline Networking Alliance), Bluetooth, and/or other network protocols.
- The MHL (Mobile High-Definition Link) Consortium whose hardware technology is analogous to USB in that the TV (or monitor) provides power to the connected device through the same cable that delivers audio, video, and control signals between the two devices.

- Wi-Fi Alliance who focuses on the hardware and software technology development and regulatory programs to certify interoperability of wireless LAN (Local Area Network) products based on the IEEE 802.11 specification.

Researched and analyzed by hardware/software—experienced technical journalist and principal analyst Robert Cravotta, the report is based on available data and meetings with relevant companies as well as technical background provided by Encore Info’s experienced team.

Table of Contents

- Executive Summary
- Worldwide Connectivity Semiconductor Revenue
